# CPU SCHEDULERS COMPARED

By graysky 20-Oct-2012

# <sup>2</sup> Introduction

Purpose

Benchmark details Test CPUs/systems

### Purpose

Con Kolivas' Brain Fuck Scheduler (bfs) was designed to provide superior desktop interactivity and responsiveness to machines running it.<sup>1</sup> However, it was not implicitly designed to provide superior performance. The purpose of this study was to evaluate the Completely Fair Scheduler (cfs) in the vanilla Linux kernel and the bfs in the corresponding kernel patched with the ck1 patchset. Seven (7) different machines were used to see if differences exist and, to what degree they scale using *performance based* metrics. Again, these end-points were never factors in the primary design goals of the bfs.

(1) http://ck.kolivas.org/patches/bfs/sched-BFS.txt

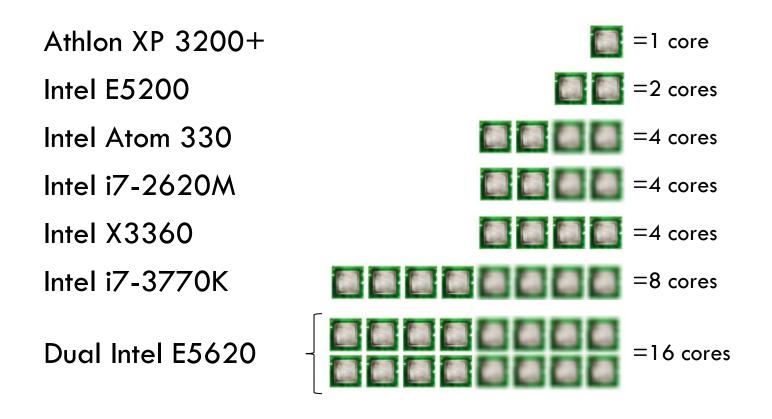

### **Benchmark Details**

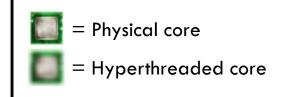

The collective benchmark was called from a simple Bash script that ran each individual benchmark task multiple times – at least ten – in order to get a decent number of observations to power a statistical comparison. Test machines were booted into either the stock kernel or into a corresponding ck1 patched kernel and then challenged with three different benchmark tasks. The time to complete each task was captured to a log file and the test repeated:

- Compilation using gcc to `make -jx bzlmage` for a preconfigured linux kernel v3.6.2.<sup>2</sup>
- 2. Compression using Irzip to compress the source tree for the linux kernel v3.6.2.
- 3. Video compression using ffmpeg to transcode a 720p MPEG2 clip to a 360p video suitable for playback on a smartphone.

(2) In the `make -jx bzImage` statement, x=(number of physical cores + virtual cores)+1. I am aware that it is recommended NOT to use the +1 for kernels running the bfs but felt that in order to fairly compare both schedulers, this needed to be held constant.

### **CPUs Compared with Core Count**

Each test machine ran Arch Linux  $x86_64$  except for the Athlon XP which ran Arch i686 due to its lack of 64-bit support.

### **Results and Conclusion**

6

Compression Benchmark Make Benchmark Video Encoding Benchmark Conclusion

### **Compression Benchmark Results**

CPU	Average	Time (sec)	CK Kernel is		
	Vanilla	CK-Patched	Difference	Result	
AMD Athlon XP	558.3320	547.7577	-10.5753	1.9 % faster	
Intel E5200	166.3141	165.7622	-0.5519	0.3 % faster	
Intel Atom 330	470.0283	454.8185	-15.2098	3.2 % faster	
Intel i7-2620M	81.2978	79.4898	-1.808	2.2 % faster	
Intel X3360	68.2635	67.7987	-0.4648	0.7 % faster	
Intel i7-3770K	35.2904	34.3310	-0.9594	2.7 % faster	
Dual Intel E5620	27.7919	28.2716	+0.4797	1.7 % slower	

Small (1-3 %) efficiency/speed gains were observed almost universally across the test systems when timing compression using Irzip. The notable exception being the multi-socket machine which was around 2 % slower.

### Make Benchmark Results

CPU	Average	Time (sec)	CK Kernel is		
	Vanilla	CK-Patched	Difference	Result	
AMD Athlon XP	1,120.6486	1,095.6486	-25.4671	2.3 % faster	
Intel E5200	374.0274	366.0912	-7.9362	2.1 % faster	
Intel Atom 330	1,568.5016	1,546.4804	-22.0212	1.4 % faster	
Intel i7-2620M	192.5477	190.6712	-1.8765	1.4 % faster	
Intel X3360	127.6179	127.2340	-0.3839	0.3 % faster	
Intel i7-3770K	68.9835	67.9671	-1.0164	1.5 % faster	
Dual Intel E5620	74.1218	68.2665	-5.8553	7.9 % faster	

Small to moderate (2-8 %) efficiency/speed gains were observed across all test systems with the gcc-based endpoint. Of note is the multi-socket "dual quad" machine which saw the largest boost using the bfs of nearly 8 %.

### Video Benchmark Results

CPU	Average	Time (sec)	CK Kernel is		
	Vanilla	CK-Patched	Difference	Result	
AMD Athlon XP	380.8340	386.4206	+5.5866	1.5 % slower	
Intel E5200	102.3183	99.8744	-2.4439	2.4 % faster	
Intel Atom 330	471.0781	443.4450	-27.6331	5.9 % faster	
Intel i7-2620M	50.1631	48.7489	-1.4142	2.8 % faster	
Intel X3360	39.3656	37.6724	-1.7232	4.4 % faster	
Intel i7-3770K	19.6863	18.1044	-1.5819	8.0 % faster	
Dual Intel E5620	30.9037	30.7141	-0.1896	0.6 % faster	

Small to moderate (2-8 %) efficiency/speed gains were observed almost universally across the test systems when timing ffmpeg video encoding. Here the oldest CPU showed a slight decrease in speed of around 1.5 %.

### Conclusion

In addition to the primary design goals of the bfs, increased desktop interactivity and responsiveness, kernels patched with the ck1 patch set including the bfs outperformed the vanilla kernel using the cfs at nearly all the performance-based benchmarks tested. Further study with a larger test set could be conducted, but based on the small test set of 7 PCs evaluated, these increases in process queuing, efficiency/speed are, on the whole, independent of CPU type (mono, dual, quad, hyperthreaded, etc.), CPU architecture (32-bit and 64-bit), and of CPU multiplicity (mono or dual socket).

Moreover, several "modern" CPUs (Intel C2D and Ci7) that represent common workstations and laptops, consistently outperformed the vanilla kernel at all benchmarks. Efficiency and speed gains were small to moderate.

# 11 Appendix/Supporting Information

List of software used

Additional hardware details

Statistical relevance of results and more details

### Software Used

12

The requisite software packages used for each task came from the official Arch Linux repos with the exception of the linux-ck packages which came from the unofficial linux-ck repo.<sup>3</sup> Package names including version numbers:

- □ linux-3.6.2-1
- □ linux-ck-3.6.2-1

□ linux-ck uses bfs v0.425 contained in the 3.6-ck1 patchset.<sup>4</sup>

- □ gcc-4.7.2-1
- □ ffmpeg-1:1.0-1
- □ Irzip-0.614-1

Finally, the Oneway ANOVA plots presented in the Appendix were generated using version 10.0 JMP.<sup>5</sup>

<sup>(3)</sup> https://wiki.archlinux.org/index.php/repo-ck

<sup>(4)</sup> http://ck.kolivas.org/patches/3.0/3.6/3.6-ck1/patch-3.6-ck1.bz2

### Software Used

13

The Bash script used to drive the benchmarks and to create the log file is available in graysky's github.<sup>6</sup> Users may edit the initial variables in the script to repeat this study on their own systems. The Linux source code can be downloaded from http://kernel.org which will provide substrate for the "Make" and for the "Compression" benchmarks. Due to copyright limitations, I am unable to provide the 2 min 720p MPEG clip, but users seeking to run the "Video" benchmark need only provide their own clip and edit the video clip name variable in the script as a workaround.

The raw data generated during the course of this study and also presented in the Oneway analyses on the slides to follow is available as a tab delaminated text file.<sup>7</sup>

### **Additional Hardware Details**

CPU Model	Clock Speed (GHz)	RAM (GB)	Comment
AMD Athlon XP 3200+	2.20	1.0	
Intel E5200	3.33	4.0	Overclocked 12.5x266
Intel Atom 330	1.60	2.0	
Intel i7-2620M	2.70	4.0	
Intel X3360	3.40	8.0	Overclocked 8.5x400
Intel i7-3770K	4.50	16.0	Overclocked 45x100
Dual Intel E5620	2.83	8.0	Dual socket machine

Note that the overclocked systems have been deemed "stable overclocks" though hours of punishment without errors including torture testing with mprime, linpack, systester, and with gcc. For more on Linux stress testing, see: https://wiki.archlinux.org/index.php/Stress\_Test
